Failing Custom Programs Kill Efficiency

Southwest Shipyard

Houston, Texas

Project Description

Southwest Shipyard had a problem. A custom timecard program required modification so that timecards could be generated based on a reorganization of Locations, Yards, and Supervisors. The custom program was built over 10 years ago.

Southwest Shipyard reached out to OnPoint and requested an estimate to modify the customization.

OnPoint first determined that we *could* modify the program, then understood the business impact and that a cost/benefit impact made sense for Southwest Shipyard. OnPoint then estimated cost to modify the program which Southwest Shipyard approved.

The Solution

To solve the problem one of OnPoint's developers modified the program, then worked with an OnPoint Consultant and a Southwest Shipyard payroll staff personf to test the solution.

The Result

Southwest Shipyard approved the change with rave reviews of OnPoint's ability to complete the change on time, and on budget so that the program could be used in the next payroll cycle.

How This Can Apply to Your Company

Your business may be different than when you implemented your software, or there may be redundant data entry that you do in Excel creating inefficiencies and opportunity for error. Partner with the right resources for support and customizations that pay off quickly by increasing efficiencies, allowing you more time to work on "everything else".
